

Complete Fiber Management System

The Boss Line is a complete fiber management system. The Boss Line expands beyond the original Yard Boss log management module to include the Yard Boss chip management system and Scale Boss, our weigh scale software. The system collects data and reports on many aspects of the fiber flow. A key feature is its ability to seamlessly handle the forest industry's complex contract administration process.

The Boss Line products can be installed as an integrated system operating from a central database or as individual systems. The Boss Line applications easily interface with other information systems and technologies.

YARD BOSS

Yard Boss can help your forest company manage inventory and contracts with increased efficiency and for maximum value. The system tracks loads of logs and chips, links them to the primary contract and calculates vendors' payments. The system generates reports on inventory that provides you with a snapshot of the cost of obtaining current inventory, as well as its attributes. Yard Boss is easily integrated with your other information technologies such as enterprise financial systems, land and resource management systems and data collection hardware. Yard Boss helps companies minimize hours and human errors associated with contract payment, while also providing current information about your inventory.

The newest feature in Yard Boss is a chips management module. The chips module works within the business rules that apply to chips and other wood commodities. In addition to contract administration and inventory tracking, this module accommodates complex quality parameters associated with purchased chips and applies bonuses or penalties where applicable. This feature is unique to our Yard Boss program.

SCALE BOSS

Scale Boss communicates directly with the weigh scale hardware and links load weight with detailed information about inbound and outbound loads. The system is designed to increase accuracy and reduce the time required to enter and check load data. Scale Boss can operate as a stand-alone application with its own database, or send data “live” into the Yard Boss via the local area network (LAN). If the LAN goes down, the scale continues to accept and process data. It automatically synchronizes with the main database when the network comes back up.

This screen capture is typical of those found in Scale Boss. The fields on the left-hand side (Driver ID, Truck ID, Direction, etc.) can be configured to match a company’s business rules.

SCALE BOSS CUSTODY MANAGER

Scale Boss Custody Manager combines ALDATA Software’s Scale Boss system and TAGASIS. TAGASIS is our onboard computer that tracks and generates reports on the location and activities of heavy equipment. Scale Boss Custody Manager uses Geographic Positioning Systems to track the movement of wood from the forest to the mill. Your company can use this powerful tool to demonstrate chain of custody and to protect yourself from fraudulent activities.
